

Your testers already wrote the automation.

AskUI runs your manual test cases, as written, on desktop apps, head units, machine HMI's and Citrix: the screens selector-based tools can't reach. Every step proven. Nothing leaves your network.

How it works

1 · Bring the suite

Plain language in.

Markdown, CSV or an exported PDF spec, kept in your own Git repository. No scripts, no selectors.

Steps

1. Open Radio from the home screen
2. Long-press "FM 98.4"
Expected: Saved to preset 2

2 · Point it at the system

Any screen a tester sees.

AgentOS gives the agent screen, keyboard and mouse. On head units and HMI's it works over HDMI capture and USB HID, with nothing installed.

3 · Read the verdict

Every step. Proven.

A verdict, a screenshot and the full transcript for every step of every test, as Markdown and PNG your CI can archive.

What's inside

The harness

Builds the same layered context for every test, your rules last. Caches it for speed. Fixed rules decide the verdict.

Beyond the screen

SQL, HTTP, shell and custom C# tools. Drive bench tools such as Vector CANoe, dSPACE or CanTools in the same test.

CI and Claude

Runs in GitHub Actions, GitLab or Azure DevOps. AskUI is also an MCP server: Claude and other agents can run tests and read verdicts.

Dreaming

Studies past runs and proposes fixes to rules as diffs. You approve every line.

Your model, your network

Anthropic, Azure AI Foundry or self-hosted. Offline licence key for air-gapped labs. ISO 27001, GDPR.

Many machines

One agent, several machines in one test. A Windows service that survives RDP disconnects and runs overnight.

Zucchetti

Priced per agent. Not per seat.

- One unit: the concurrent agent
- Unlimited users, no per-test fees
- No inference fee on your own model
- 14-day free trial; Team and Enterprise quoted in writing

Two ways to start

- **Try it yourself:** download AskUI Desktop for Windows or macOS and sign up in the app
- **Run it with an engineer:** send ten of your test cases; we run them on your bench, VM or lab
